A TOUGH MIXTURE.

tel Lankershim.

The disadvantage of mixing politics with city business has been very clearpresent municipal management.

Under a regime that has ignored the simples rules of business economy any criticism of the administration is answered by a political argument.

Suggest, in all kindness, that the law provides certain limits of indebtedness which the administration is disregarding, and the reply is that this administration is going to spend money whether it is within the law or not.

THE WELLMAN AIRSHIP.

(Washington Star.) The greatest interest is being taken throughout Norway in the airship experiments of Walter Wellman, the American, the north pole, a la Jules Verne, According to the present plans of Mr. Wellman, during the first week of July there will be trials of the airship until it is demon-strated that the latter is ready for the voyage. The start for the pole will be made on the first favorable opportunity afterward, probably between July 20 and Aug, 10, but if necessary Mr. Wellman is prepared to start as late as Aug. 20 mbers of the expedition of Mr. Walter Wellman, Major Hearsev (executive officer and scientific observer), who has been the United States government; (surgeon), and M. Gaston Hervieu, the aeronautical engineer and the only Frenchman on the staff. About thirty men constitute the total expeditionary force, though, of course, some of these are sailors and mechanics and have noth-

ing to do with the expedition besides aid-ing in handling the balloon car, gear, etc., t Tromso and at Spitzbergen. Discussing his plans, the American exlorer said: "There was no question of ast year's expedition having been a An enormous amount of work had to he done at Spitzbergen-work which was found to be too much for one short Arctic

This year on arriving at Spitzbergen there is little work to be done in the mat-ter of the erecting of buildings. We have onstructed an entirely new airship, with which we hope to accomplish the end we have in view, namely, an aerial journey from Spitzbergen to the Pole and back. "One of the most important changes we have effected has been the enlargement of the balloon of the airship. This has been made eighteen feet longer and its lifting power increased by 3,000 pounds, giving a total lifting force of 19,500 pounds. The balloon is 184 feet long and fifty-two feet in its greatest diameter, its cubic vol-ume being 265,000 feet. With the single exeption of Count Zeppelin's airship, this the largest ever built. The next important change in our last year's equip-ment is that we have built an entirely new car and mechanical equipment, all of that used having been discarded. The new car consists of a framework of steel tubing 115 feet long, ten feet high and eight feet broad. This is suspended close under the balloon at such distance that those standing on the top of the car can easily reach the balloon. The keel or backbone of the airship consists of a The keel or steel tank eighteen inches in diameter 115 feet in length, with a capacity for holding 1,200 gallons of petrol.

top of this tank will be really the deck of our ship. By this disposition we make the weight of the tank, which is about 1,000 pounds, do double duty, for it is not only a safe reservoir for our petrol, but at the same time gives rigidity to the structure of the ship. This tank is di-vided into fourteen compartments to prevent the danger of explosion, and the petrol can be pumped from any section of the tank so as to trim the ship. The ear is inclosed with tightly-stretched silk. the two sides forming a vertical plane and the wide roof a horizontal plane, all con-structed for giving stability to the ship in the air. At the stern of the vessel is a rudder of some 900 square feet in the form of a bicycle wheel, which despite its great size only weighs thirty pounds. A little forward of the center is placed a very heavy motor, built for endurance and safety, of seventy horse-power and hav-ing a weight of 900 pounds, which is warairship the propellors, which are of the same type as those used in French military airships, are placed in the center of either side of the vessel. They consist of two blades of steel eleven feet in diameter and capable of 380 revolutione per

"The living quarters of the airship are in triangular bunk-like spaces within the inclosed car. These are capable of accommodating ten or twelve men and 'How's all the family' at the end."

twelve dogs, together with our provisions and equipment. Suspended from the roof of the airship and running on light rails is a tank containing 600 pounds of provisions, which by means of a windlass in the navigating room can be run the entire length of the car, so as to supply our food whenever necessary and also to balance the ship. The total weight of much trouble the steel car and tank is 2,200 pounds. a real count.

The motors, screws and machinery, weigh 1,350 pounds. We carry in our tank 6,000 pounds of petrol, capable of running the motor for 150 hours at a normal speed of fourteen knots per hour, giving a total radius of action from the liquid fuel of 2,100 knots. The weight of the cargo we carry diminishes on an average 600 fered him pounds per day by the consumption of petrol for the motor, while the the skin of the balloon will probably not exceed 150 pounds per day. The net result of this is that we have on an average day 450 pounds to 500 pounds of lifting force no longer required and represent maintain the equilibrium of the "Ordinarily the surplus gas would be inasmuch as hydrogen has a very high to waste good fuel, and by actual experi ments we have found that we can burn the surplus hydrogen in our motor with the result that we have a further thirty hours of motoring from waste gas, giving a total of ten hours at fourteen knots per hour—that is to say, we have a total radius of action of 2,500 miles, or double the

distance from our base to the pole and back again. If we can get but two-thirds of the value of these figures we shall still have 50 per cent margin over our needs for our journey from Spitzbergen to the pole and back. "It is our intention during our voyage to the pole to be always in contact with the earth by means of a guide-rope. We est place in San Francisco."

Why should Mayor Schmitz object to being in jail? It seems to be about the safety place in San Francisco. shall never ascend more than 300 feet to 500 feet, and our guide-rope will trail over the surface of the earth. This guide-rope the surface of the earth. is absolutely essential to the safety navigation and is of considerable weight. Instead of employing a steel line we have made what I call a leather serpent fif-teen inches in diameter and 140 feet long and weighing about 1,400 pounds. This is packed full of reserve food, weighing 1,200 pounds, and is suspended from the airship by means of a steel rope. It is covered with steel scales to protect th leather and to make the whole guide travel smoothly over ice and snow. also float on the sea. By means of the enlargement of the airship and food con- tended strictly to business. His hat tained in the guide-rope we are able to carry with us a total of 3,000 pounds of food, or enough to enable the crew of the presence of the headgear was evidence airship to subsist on its own stores for a period of ten months without having recourse to game or outside supplies.

PROVING CHARACTER.
